Empathy Map

An Empathy Map is a customer-centric tool used to better understand the needs, thoughts, behaviors, and emotions of the target users. It helps the development team gain deeper insights into the customer's perspective by analyzing what they say, think, do, and feel regarding a particular problem. Creating an empathy map enables the team to design solutions that effectively address user challenges and improve overall user experience.

For the OptiCrop project, the empathy map focuses on farmers and agricultural stakeholders who face difficulties in selecting the most suitable crop based on soil nutrients and environmental conditions. Understanding their concerns, expectations, and decision-making processes helps in developing an intelligent crop recommendation system that meets their needs.

SAYS

Farmers often express concerns about selecting the right crop that can provide better yield and profitability. They seek reliable guidance and recommendations because agricultural decisions are becoming increasingly complex due to changing environmental conditions and soil variability. Their conversations usually revolve around improving productivity while minimizing risks.

THINKS

Farmers constantly think about whether their crop selection decisions are correct and suitable for their land. They worry that choosing an unsuitable crop may lead to lower yields, financial losses, and inefficient use of resources. At the same time, they believe that modern technologies and data-driven solutions can help them make more informed farming decisions.

DOES

To make better agricultural decisions, farmers test soil conditions, monitor environmental factors, and gather information from agricultural experts, government agencies, and fellow farmers. They also explore available technologies and resources that can help improve productivity, optimize crop selection, and increase farm profitability.

FEELS

Farmers often feel uncertain and stressed when deciding which crop to cultivate because their livelihood depends on the success of their harvest. They are concerned about crop failure, unpredictable environmental conditions, and economic losses. However, when provided with accurate recommendations and scientific insights, they feel confident, hopeful, and motivated to adopt better farming practices.

Persona: Farmer / Agricultural Practitioner

The primary user of OptiCrop is a farmer or agricultural practitioner who needs support in selecting the most suitable crop based on soil nutrients and environmental conditions. Their goal is to maximize yield, improve resource utilization, reduce risks, and make informed agricultural decisions using technology-driven recommendations. 📱 🚜 📊
